DESCRIBE THE PRESENT AND ORIGINAL (IF KNOWN) PHYSICAL APPEARANCE

This structure faces the southeast along the northern bank of Deer Creek. It has been refurbished by the Maryland Department of Forests and Parks. It is almost thirty feet high, with a square base of uncoursed rubble stone and a cylindrical main portion of the same material. The cone-shaped top contains the flue and is of brick. There are two openings in the furnace, one on the northern side of the base, and the second at the level of the brick cone on the southeast side. These openings were used for the adding of fuel and ore and for the removal of slag and ash.

STATEMENT OF SIGNIFICANCE

In the late Eighteenth and the early Nineteenth Centuries, a number of limonite iron furnaces flourished along Deer Creek, with a number of them being located near Stafford. A 1719 Act of Assembly offered 100 acres to anyone who could erect a productive furnace. Two of the earliest furnaces were located not far from the one that stands today. The first, Cumberland Forge, was located one-half mile north of the mouth of Elbow Branch and was built in 1749 by Nathaniel Rigbie, Nathaniel Rigbie, Jr., John Hall and Jacob Giles. Jacob Giles, Jr. acquired the plant in 1775 and John Stump became the owner in 1794. The second forge stood on the Creel property along the creek and was built by George Rock in 1749. The Rock Forge was operated for a time by the Onion and Lawson concern, which owned similar furnaces along the Little Gunpowder. The existing furnace is probably not as old, seeing its heyday when this stretch of Deer Creek was a complex flint, iron and milling plants under the ownership of Herman Stump, Edward M. Allen and Charles Forwood. A photograph of what is most likely the present structure can be found on page 157 of C. Milton Wright's Our Harford Heritage, this photograph dating from 1885. The furnace was not only employed as a smelter for limonite iron ore, but also, after the iron trade became unprofitable, a kiln for flint. Both the iron ore and the raw flint were transported to the furnace site by barge. At that time, the stream was deeper and in the Eighteenth Century, there had even been an island near the creek's mouth.
